Supplemental figure 1

A. Levels of CK, amylase, AST, ALT, CRP, creatinine, BUN, T Bil, albumin, glucose, K+, Ca+, and Na+ are shown as the median ± 95% confidence interval (CI) of individual values, according to the number of days after disease onset as follows for fatal EVD patients (red circles): 1-3 days after disease onset \((n=9, \text{except for albumin}: n=8)\), 4-6 days \((n=10, \text{except for albumin, CRP, Ca+ : } n=9 \text{ and } \text{AST, CK, K+ : } n=8)\), 7-9 days \((n=5, \text{except for albumin, T Bil : } n=4 \text{ and } \text{AST, K+ : } n=3)\) and 10-13 days \((n=6, \text{except for AST : } n=5 ; \text{CRP, K+, T Bil : } n=4 \text{ and } \text{CK : } n=3)\) and for non-fatal EVD patients (green circles): 1-5 days after disease onset \((n=5, \text{except for CK and K+ : } n=4)\), 6-9 days \((n=7, \text{except for AST, K+ and T Bil : } n=6)\), 10-13 days \((n=7, \text{except for CK 7 : } n=6)\), 14-17 days \((n=12, \text{except for CRP : } n=11)\) and 18-24 days \((n=8, \text{except for BUN : } n=7)\). The median ± 95% CI of individual values for febrile patients without EVD \((n=27)\) is presented for each analyte.

B. Plasma IL-6 concentrations for fatal (red squares) and non-fatal (green squares) EVD cases are shown as the median ± 95% CI of individual values, according to the number of days after disease onset as follows: 1-2 days after disease onset \((n=8 \text{ and } 6 \text{ for fatal cases and survivors, respectively})\), 3-4 days \((n=11 \text{ and } 7, \text{respectively})\), 5-6 days \((n=12 \text{ and } 6, \text{respectively})\), 7-8 days \((n=7 \text{ and } 6, \text{respectively})\), 9-12 days after disease onset for fatal cases \((n=5)\), and 9-11 \((n=8)\), 12-14 \((n=6)\), 15-17 \((n=11)\) and 18-21 \((n=6)\) days after disease onset for survivors. The median ± 95% CI of individual values for febrile patients without EVD \((n=15)\) is also presented.
